

ABSTRACT

Documents are processed collectively by multiple printing devices. A printing device receives a request to print a document, and partitions the document into one or more blocks. The printing device communicates, to each 5 of one or more additional printing devices, at least one of the one or more blocks. The additional printing devices convert the portions they receive to a print-ready format, and return the portions in the print-ready format to the printing device. The printing device uses the portions in print-ready format received from the additional printing devices to print the document.
